1- Agricultural Research center of kermanshah

2- Agricultural Extinction managment ,organization of kermanshah

Due to the economic values of fig trees in some regions of Kermanshah province one of the causes would reduce yield to figtrees , is unknown gardener of polination and caprifig in figtrees. Some of cultivar needed for suitable produce fig wasp (*Blastophaga Psenes*).polination time is one of the most important subject in figtrees. At the present review of three zonal orchard fig "Rijab,Pyran,KHanagha" on the two cultivar exporting fig namely "SHam,Manjifi" determinate needed pollination at the different time. In spite Manjifi cultivar more Sham cultivar and need wasp caprifig and timing weekly to tenth day later first june to late june .the suitable time pollination amount fruit of caprifig is forty fruit the same as .05 K . THis amount differently due to age and power reproduction to excess also the time pollination the zonal is different .Conclude the trees design compare to control 60 percent excess yield. The sanity is caprifig because the larva "*Carpolonchaea Aristella*" to this way contamination the orchard fig .
