

Effects of foliar Application of Fe - EDTA on the Yield of Cucumber (*Cucumis sativus* L.) CV.G.R.C.8.

foliar application of Fe - EDTA in 0,1,2,3,4,5/1000 concentrations was used four times . first application was when the plant had 8 leaves , and the other applications were 4,8 and 12 weeks after first application , respectively. The *comparision of means of interaction effects between times of application and concentration* , showed that . 4 times application with 4/1000 concentration . increased the yield about 25 percent more than control plant.
