

## **Urban green space and it's applied amalgamation**

**T. Amirghasemi**

Deputy of Horticulture, Ministry of Agriculture, Tehran.

The tendency of urban living and using the provided possibilities in the cities has caused the separation between human kind and nature. Changes of urban environment have gradually decreased it's green spaces and open area. Therefore, a retaining wall has been created between human kind and beautiful nature. Besides, the crowded area and existing of factories and city vehicles make pollution. In such cases the role of green spaces for adjusting the unsuitable environment condition is very important. For this reason, during the structing of urban building the foreseeing green spaces share have even more priority to the foreseeing streets, roads and soon for urban planners.

On the other hand, there must be a logicrelation between the urban in habitants and green spaces and this connection should be continued.

It seems that the best solution for such combination is the connection of the applications. The reason for such giving suggestion is that the urban planners for spending the reaction times or accessing to the green spaces into the services or cultural places and the conclusion of such combination (green spaces in services and cultural centers) will benefit the urban inhabitants. Establishing the store departments, libraries, theatre halls, cinemas and other reaction centers into the green spaces will increase the connection of people with the green spaces.

In one word, human kind has not yet succeeded completely to adapted his environment condition with the speed of technology progressing. Therefore, in order to decrease the losses which has been caused by urban living and being far from the biology needs, the human kind should provide different matters such as amalgamation of the urban green spaces with different application hope by such kind action, the human kind will be more closer to the nature.
