
Identification and introduction of grape cv. Khoshnaw (agronomical and genetical aspects)**M.J.Karami**

Kordestan Agriculture Research Center, Sanandaj.

In this paper a cultivar of rainfed grape which is studied during 1993-1966 has been introduced. According to the I.B.P.G.R. descriptors, preliminary studies were carried out on hundred of different morphological characteristics of local Kurdestan cultivars. Due to the desired characteristics such as , high yielding , largeness of cluster, resistance to water stress and etc. the cv. Khoshnaw is suggested to be introduced as a superior cultivar for the major rainfed areas of this province.
