1,2- Borazjan, Busheher Research Center

*Experiments were conducted for 2 Years in Agricultural Research Center-Borazjan with four replications during (1372-1374) by Randomized Complete Block Design (R.C.B.D.) to determine the effect of sowing date cultivar (Imperial) on Tomato yield.*

Sowing dates were 7.15,8.1 (check), 8.15 & 9.1 Simple & combined ANOVA were used for yield. The results showed that differences were not statistically significant.

But the effect of sowing date 7.15 with 75.052 t/ha was more effective than others, and it is recommended for this province.
